What are “Data Structures”?

Data Structures allow you to manage data

Examples: Arrays, Objects, Maps, Sets

Different Tasks Require Different Data Structures

Ordered List of Data, Duplicates Allowed	Unordered List of Data, No Duplicates Wanted	Key-value Pairs of Unordered Data	Key-value Pairs of Ordered, Iterable Data
Array	Set	Object	Map

`[1, 2, 5, 3]`	`new Set()`
	`set.add('pizza')`
		`{ name: 'Max',`
		`age: 31 }`
			`new Map()`
			`map.set('loc',`
			`'Germany')`

ACADEMIND

Arrays – A Closer Look

```
[1, 3, 6, 2]
```

- Insertion order is kept
- Element access via index
- Iterable (= you can use the for-of loop)
- Size (length) adjusts dynamically
- Duplicate values are allowed
- Deletion and finding elements can require “extra work”

ACADEMIND

Sets – A Closer Look

```
new Set()
set.add('pizza')
set.add('burger')
set.add('pizza') // not added
```

- Insertion order is **not** stored/ memorized
- Element access and extraction via method
- Iterable (= you can use the for-of loop)
- Size (length) adjusts dynamically
- Duplicate values are **not** allowed (i.e. unique values only)
- Deletion and finding elements is trivial and fast

ACADEMIND

Arrays vs Sets

Arrays	Sets
You can always use arrays	Only usable if order does not matter and you only need unique values
Must-use if order matters and/ or duplicates are wanted	Can simplify data access (e.g. finding, deletion) compared to arrays

Objects – A Closer Look

```
{
  name: 'Max', age: 31,
  greet() { console.log('Hi, I am ' + this.name); }
}
```

- Unordered key-value pairs of data
- Element access via key (property name)
- Not iterable (only with for-in)
- Keys are unique, values are not
- Keys have to be strings, numbers or symbols
- Can store data & "functionality" (methods)

ACADEMIND

Maps – A Closer Look

```
new Map()
map.set('name', 'Max')
map.set(true, true) // Boolean key
```

- Ordered key-value pairs of data
- Element access via key
- Iterable (= you can use the for-of loop)
- Keys are unique, values are not
- Keys can be anything (incl. reference values like arrays)
- Pure data storage, optimized for data access

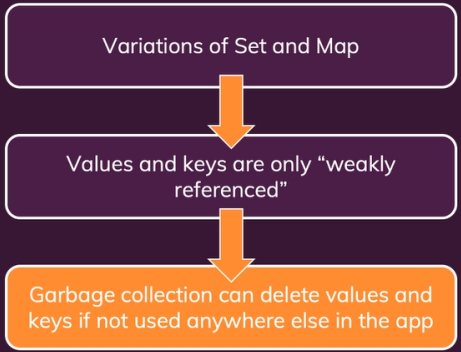
ACADEMIND

Objects vs Maps

Objects	Maps
Very versatile construct and data storage in JavaScript	Focused on data storage and access
Must-use if you want to add extra functionality	Can simplify and improve data access compared to objects

ACADEMIND

WeakSet & WeakMap



ACADEMIND

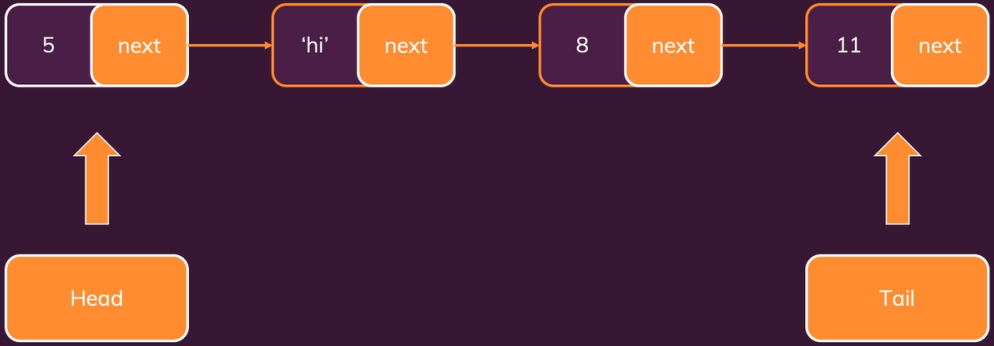
A Custom Data Structure: “Linked List”

Every element knows about the next element

This allows for efficient re-sizing and insertion at start and end of the list

ACADEMIND

A Custom Data Structure: “Linked List”



ACADEMIND

Why would you want a “Linked List”?

Historically (in other programming languages), the main reason was **memory management**: You didn’t have to specify (occupy) the size in advance

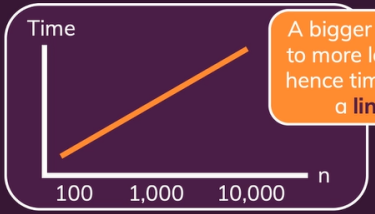
Nowadays, JavaScript has **dynamic arrays** (dynamic re-sizing built in) and memory **isn’t really the primary issue** in JavaScript apps

Linked Lists can be useful if you do a lot of **insertions at the beginning of lists** – linked lists are faster than arrays at this

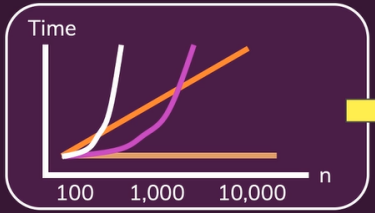
ACADEMIND

Time Complexity & Big O Notation

```
function sumUp(n) {
  let result = 0;
  for (let i = 1; i <= n; i++) {
    result += i;
  }
  return result;
}
```



A bigger number leads to more loop iterations, hence time increases in a **linear way**.



Linear Time	O(n)
Constant Time	O(1)
Quadratic Time	$O(n^2)$
Cubic Time	$O(n^3)$

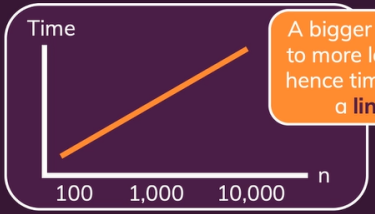
We care about the **trend/ kind of function**.

Big O Notation

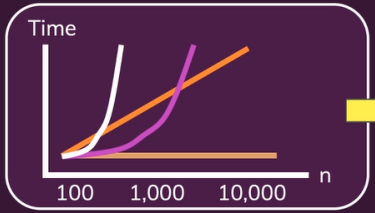
ACADEMIND

Time Complexity & Big O Notation

```
function sumUp(n) {
  let result = 0;
  for (let i = 1; i <= n; i++) {
    result += i;
  }
  return result;
}
```



A bigger number leads to more loop iterations, hence time increases in a **linear way**.



Linear Time	O(n)
Constant Time	O(1)
Quadratic Time	$O(n^2)$
Cubic Time	$O(n^3)$

We care about the **trend/ kind of function**.

Big O Notation

ACADEMIND

List & Table Structures

Arrays & Objects “on Steroids”

ACADEMIND

Module Content

What are List & Table Structures?

Stack & Queue

Hash Table

What are “List & Table Structures”?

Lists	Tables
Collections of Values	Collections of Key-Value Pairs
e.g. Arrays, Sets, LinkedLists	e.g. Objects, Maps
Great for storing values that are retrieved by position (via index or search) Also great for loops	Great for storing values that are retrieved by key Not primarily focused on loops

ACADEMIND

Stack

LIFO: Last In, First Out

A Simplified Array

Push

Pop

New items are always added (“pushed”) on top of the stack

‘Apples’

‘Pizza’

Items are always removed (“popped”) from top of the stack

ACADEMIND

Your day in the office

ACADEMIND

Stack Time Complexity & Arrays

	Stacks	Arrays
Element Access	O(1) But limited to “top element”	O(1)
Insertion at End	O(1)	O(1)
Insertion at Beginning	O(n) With “Data Loss”	O(n)
Insertion in Middle	O(n) With “Data Loss”	O(n)
Search Elements	O(n) With “Data Loss”	O(n)

ACADEMIND

Queue

ACADEMIND

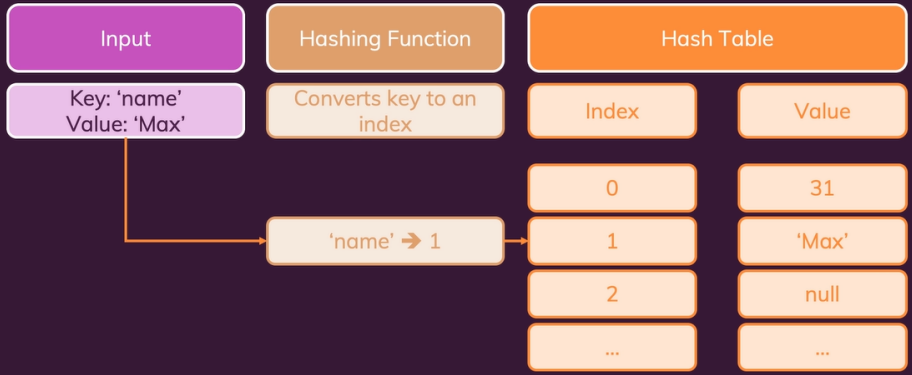
Queue Time Complexity & Arrays

	Queues	Arrays
Element Access	O(1) But limited to “first element”	O(1)
Insertion at End	O(n) With “Data Loss”	O(1)
Insertion at Beginning	O(1)	O(n)
Insertion in Middle	O(n) With “Data Loss”	O(n)
Search Elements	O(n) With “Data Loss”	O(n)

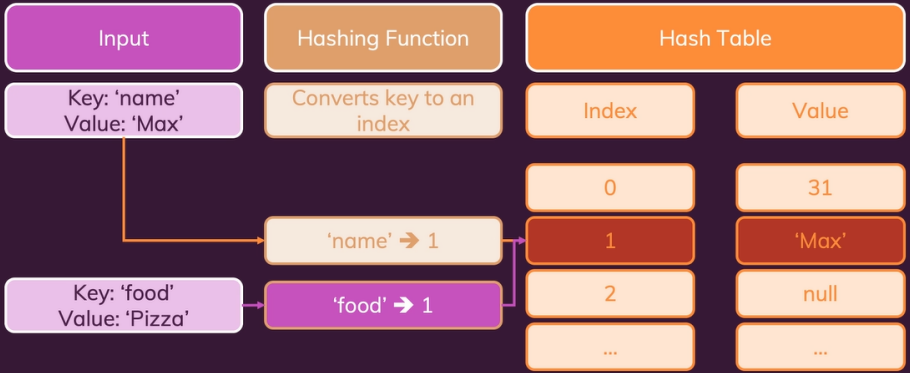
ACADEMIND

Hash Table

The existing JavaScript “object” is implemented as a Hash Table!

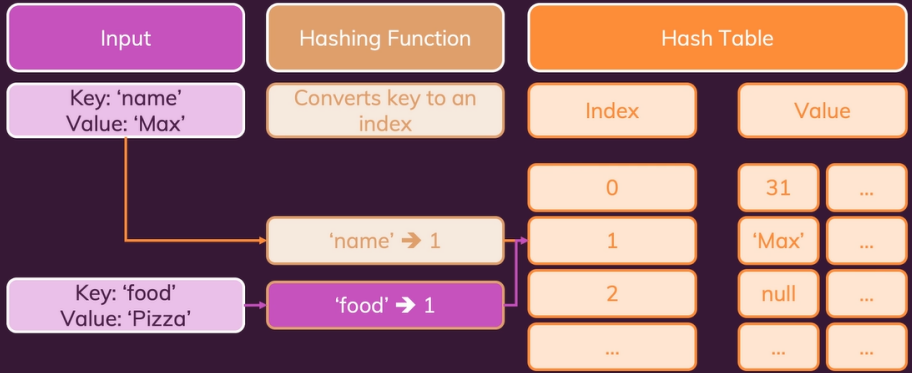


Collisions

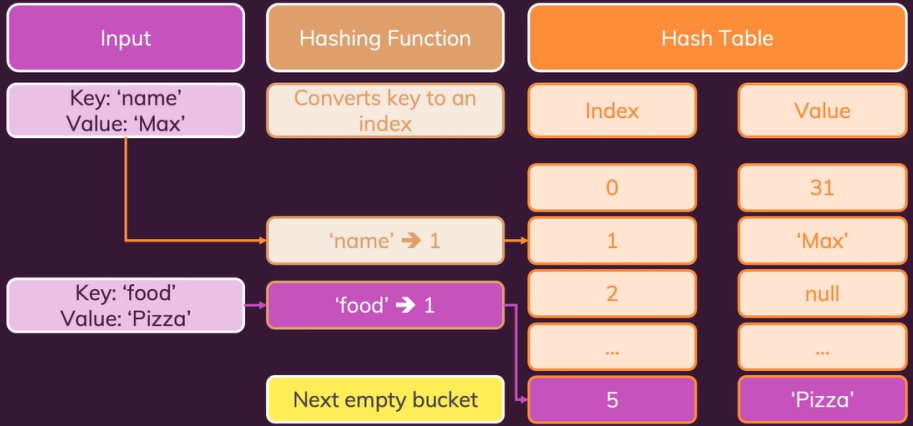


Input
Hashing Function
Hash Table
Key: ‘name’
Value: ‘Max’
Converts key to an index
Index
Value
0
31
‘name’ ➔ 1
1
‘Max’
Key: ‘food’
Value: ‘Pizza’
‘food’ ➔ 1
2
null
...
...

Resolving Collisions with “Chaining”



Resolving Collisions with “Open Addressing”



ACADEMIND

Hash Table Time Complexity & Arrays & Objects

	Hash Tables	Arrays	Objects
Element Access	O(1) in theory O(n) with lots of hash collision	O(1)	O(1)
Insertion at End	O(1) O(n) with lots of hash collision	O(1)	O(1)
Insertion at Beginning	O(1) O(n) with lots of hash collision	O(n)	O(1)
Insertion in Middle	O(1) O(n) with lots of hash collision	O(n)	O(1)
Search Elements	O(1) O(n) with lots of hash collision	O(n)	O(1)

ACADEMIND

Hash Tables vs Objects

The existing JavaScript “object” is implemented as a Hash Table!

You don’t really need to build your own Hash Tables in JavaScript!

In other programming languages, you might not have the built-in “object” data structure

It always helps to understand how the language works internally

ACADEMIND

Should You Use Objects For Everything?

No!

- Managing key-value pairs leads to redundant code for some use-cases
- Looping is typically easier for arrays/ lists
- For a lot of arrays/ lists, you don't need to do a lot of insertions at the beginning or middle or do a lot of searches

ACADEMIND

Tree Structures

Adding Depth

ACADEMIND

Module Content

What are Tree Structures?

Binary Search Tree & AVL Tree

Tries

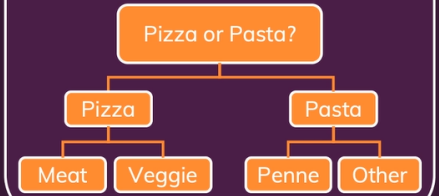
Examples for Trees

The Browser DOM

```
<html>
  <head>…</head>
  <body>
    <h2>Welcome!</h2>
    <p>This is a tree!</p>
  </body>
</html>
```

One root element (<html>) and then any amount of nested child elements (e.g. <p>)

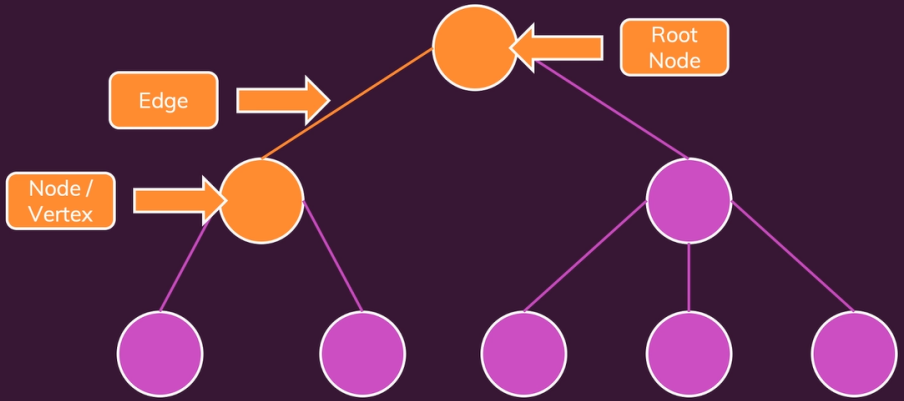
A Decision Tree



A couple of decisions where every choice leads to new possible decisions (until an outcome is reached)

ACADEMIND

What are “Tree Structures”?



A **unidirectional**, **non-linear** data structure with **edges** that connect **vertices** (nodes). There is a **root node** and there **are no cycles** (loops).

ACADEMIND

Important Terminology (1/2)

Node / Vertex	A structure that contains a value	Path	A sequence of nodes and edges that connects two nodes
Edge	A connection between two nodes	Distance	The number of edges between two nodes
Root Node	The top-most node in the tree	Parent / Child	Two directly connected nodes, parent node is “above” child node
Sub Tree	A nested tree (i.e. sub tree root node is NOT main tree root node)	Ancestor / Descendant	Two nodes that are connected by multiple parent-child paths
Leaf	A node without any child nodes (i.e. without a sub tree)	Sibling	Two adjacent nodes with the same parent

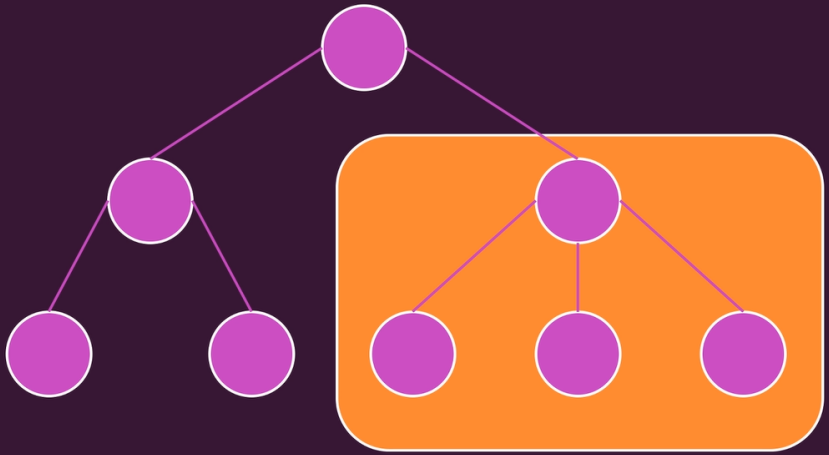
ACADEMIND

Important Terminology (2/2)

Degree	The number of child nodes of a given node
Level	The distance between a node and the root node
Depth	The maximum level in a tree
Breadth	The number of leaves in a tree
Size	The total number of nodes in a tree

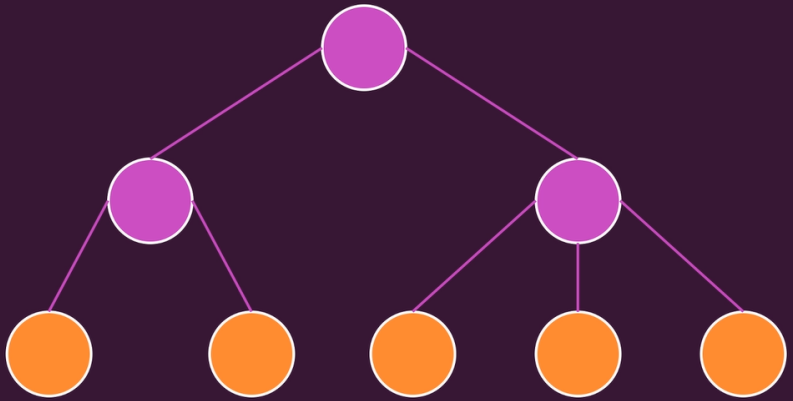
ACADEMIND

Sub Tree



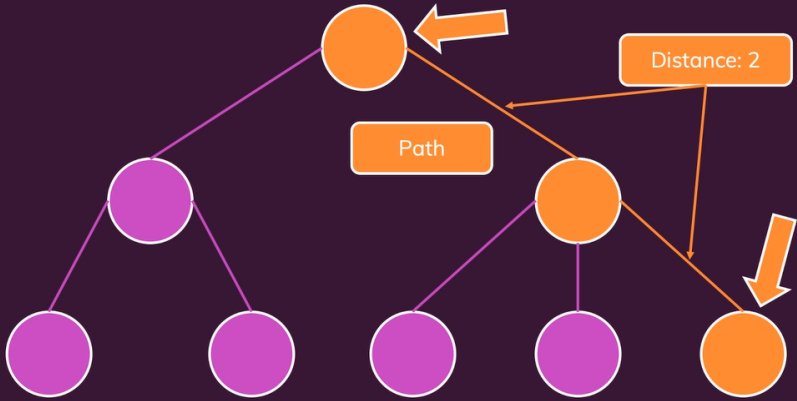
ACADEMIND

Leaf



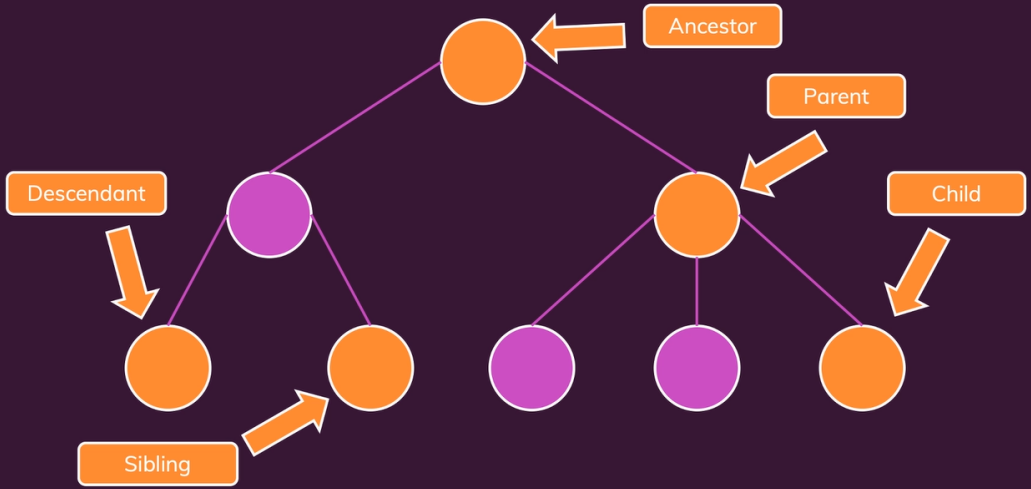
ACADEMIND

Path & Distance

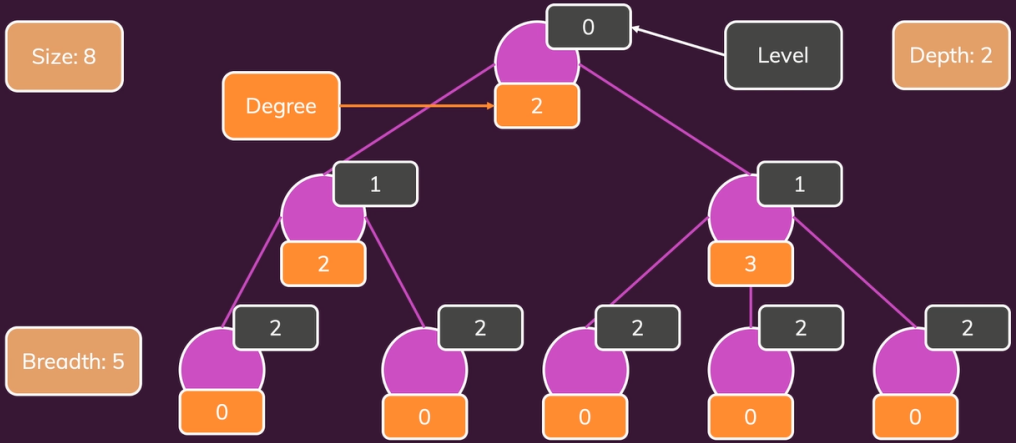


ACADEMIND

Parent, Child, Ancestor, Descendant & Sibling

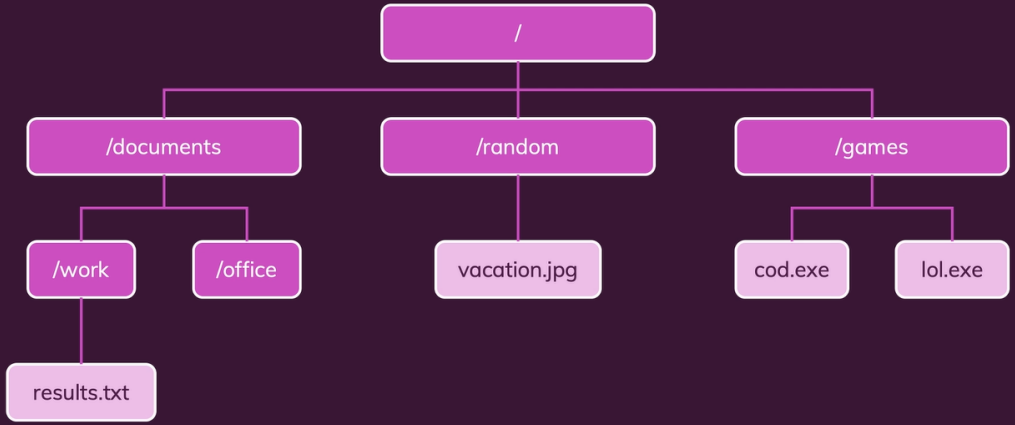


Degree, Level, Depth, Breadth & Size



ACADEMIND

Example: A Filesystem



ACADEMIND

Tree Time Complexity

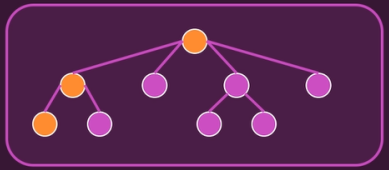
	Tree	Array
Access / Search	Worst Case: O(n)	O(1) (with Index) O(n) (Search)
Insertion	Worst Case: O(n)	O(1) (at end) O(n) (at beginning)
Removal	Worst Case: O(n)	O(1) (at end) O(n) (at beginning)

ACADEMIND

Traversing a Tree

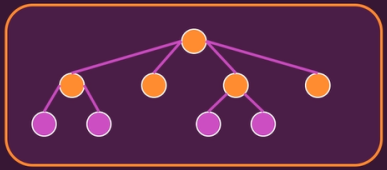
Depth-First

Dig into the tree first and explore sibling trees step by step



Breadth-First

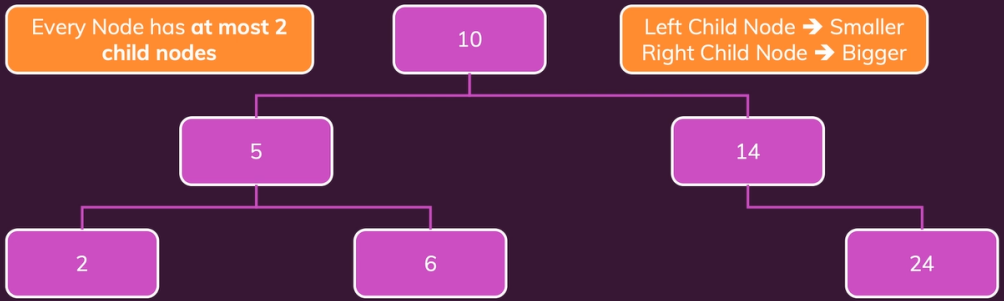
Evaluate all sibling values first before you dig into the tree in depth



ACADEMIND

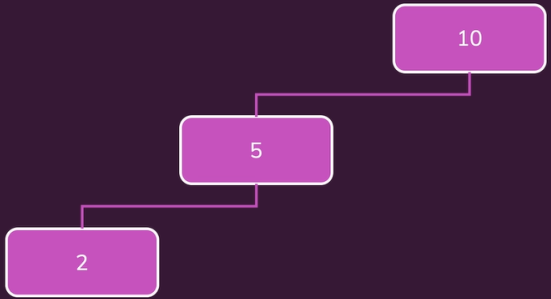
Binary Search Trees

A Tree for Sorted Data
(works with any value types!)



Binary Search Trees – Worst Case

Worst Case: Only one “line of Nodes” & Looking for “2”



ACADEMIND

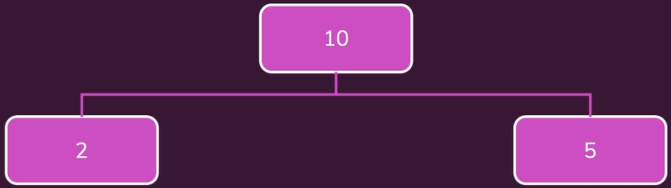
Binary Search Tree Time Complexity

	BST	Array
Access / Search	Worst Case: O(n) Average Case: O(log n)	O(1) (with Index) O(n) (Search)
Insertion	Worst Case: O(n) Average Case: O(log n)	O(1) (at end) O(n) (at beginning)
Removal	Worst Case: O(n) Average Case: O(log n)	O(1) (at end) O(n) (at beginning)

ACADEMIND

Fixing the BST Worst Case via Balancing

Subtrees should have a **depth** that is **equal or differs by at most 1**



This is called "AVL Tree"

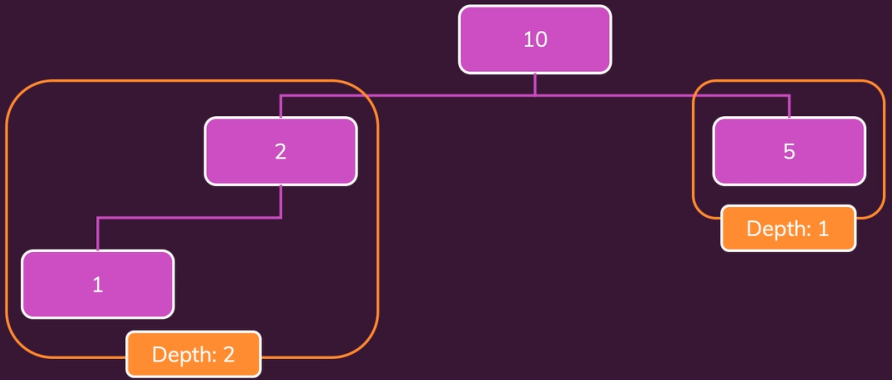
ACADEMIND

AVL?

Georgy Adelson-Velsky Evgenii Landis

A Valid AVL Tree

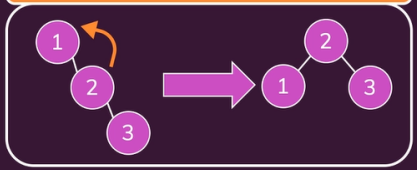
This is an AVL tree because subtree depth only differs by 1



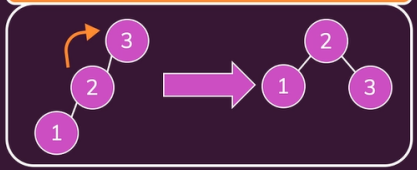
ACADEMIND

Balancing AVL Trees

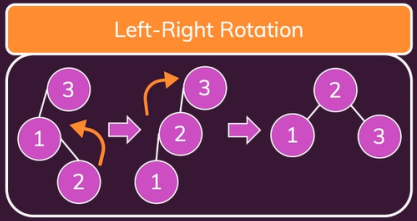
Left Rotation



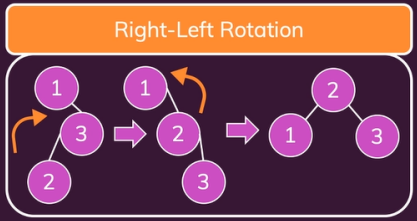
Right Rotation



Left-Right Rotation



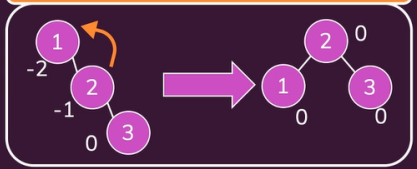
Right-Left Rotation



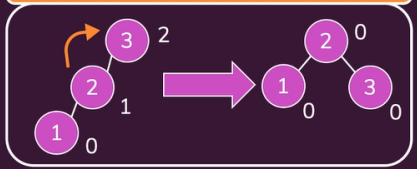
Balance Factors

Balance Factor: Difference between subtree depths (left – right)

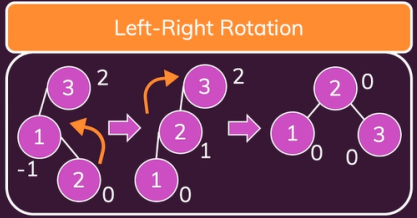
Left Rotation



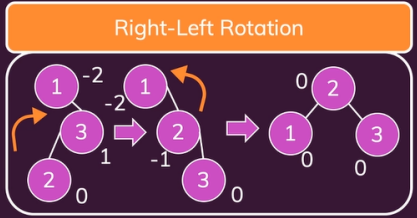
Right Rotation



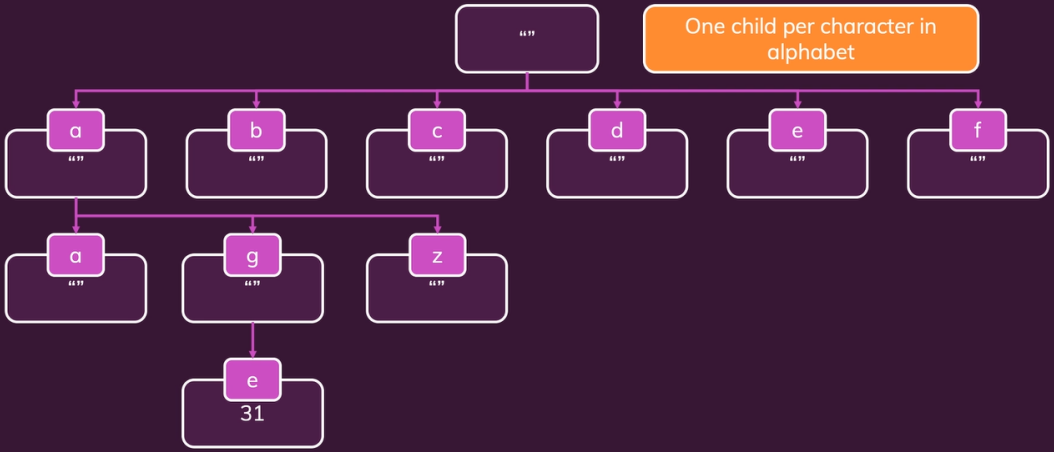
Left-Right Rotation



Right-Left Rotation

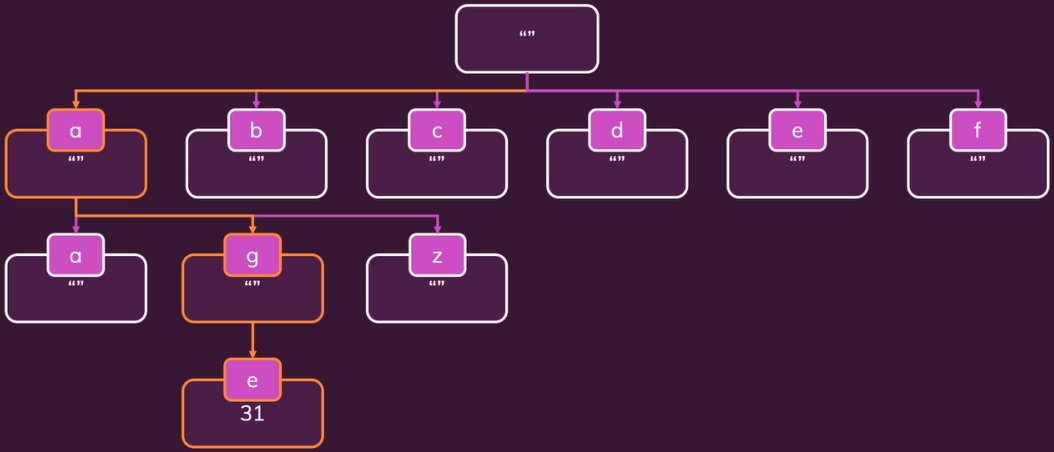


Tries



ACADEMIND

Tries



ACADEMIND

Tries – Time Complexity & Hash Table Comparison

Operation	Tries	Hash Tables
Insert	O(n)	O(n) (with hash collisions)
Find	O(n)	O(n) (with hash collisions)
Delete	O(n)	O(n) (with hash collisions)
Space Complexity	O(n*k)	O(n)

ACADEMIND

Heaps & Priority Queues

Trees with a Twist

ACADEMIND

Module Content

What are Priority Queues?

What are Heaps?

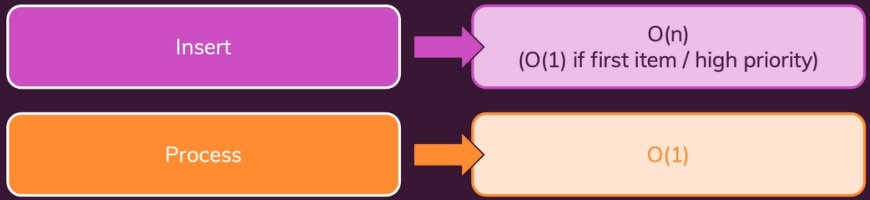
Refresher: Queues

Priority Queues

Prioritize items in a queue, **instead** of processing them one after another (with equal priority)

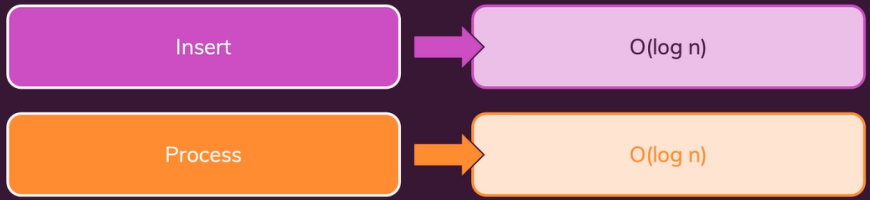
ACADEMIND

LinkedList Priority Queue – Time Complexity



ACADEMIND

Heap Priority Queue – Time Complexity



ACADEMIND

Graph Structures

"Complex Trees"

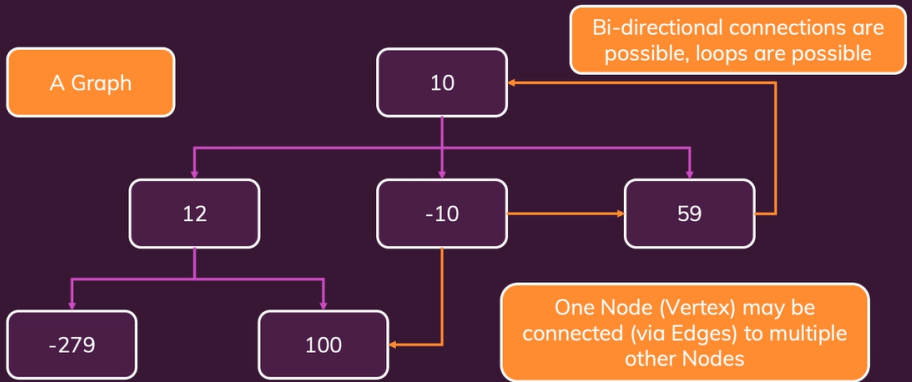
ACADEMIND

Module Content

What are Graph Structures?

Diving into Graphs

What are “Graph Structures”?

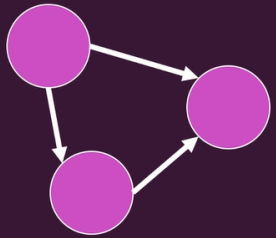


ACADEMIND

Directed vs Undirected Graphs

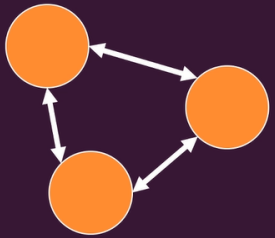
Directed Graphs

Edges between Nodes are unidirectional

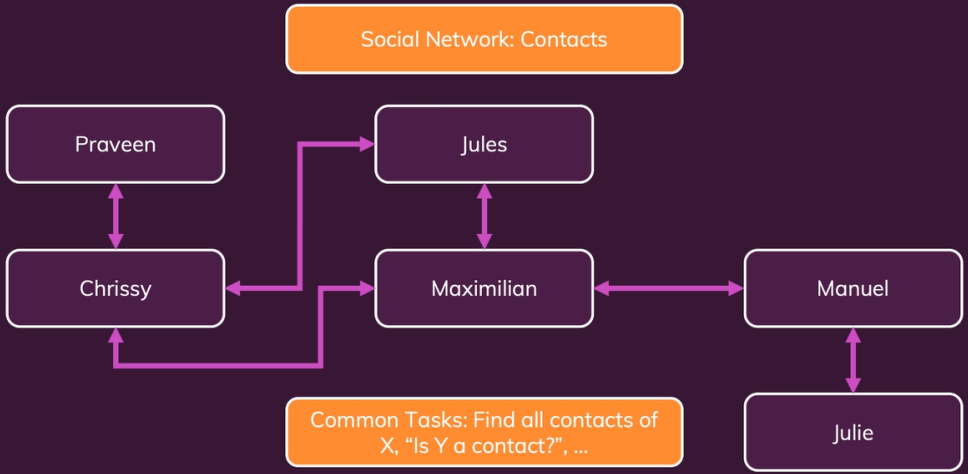


Undirected Graphs

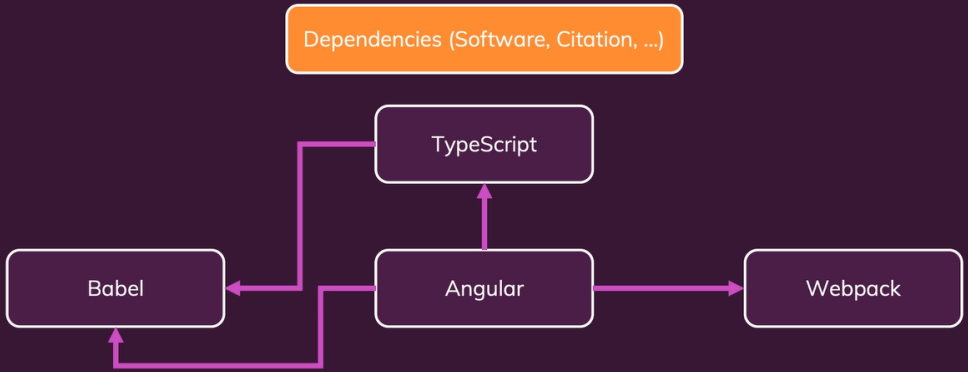
Edges between Nodes are bidirectional



Graphs in Real Life / Real Applications



Graphs in Real Life / Real Applications



ACADEMIND

More Real Life Examples

- Maps / Directions
- Knowledge Graph
- Disease Spread
- Recommendation Engines

ACADEMIND

Representing a Graph in Code

NOT as a tree with nested children! → Because there are no children

Two approaches

- Adjacency Matrix
- Adjacency List

ACADEMIND

Adjacency Matrix

	1	2	3
1			
2			
3			

ACADEMIND

Adjacency Matrix

	1	2	3
1		1	
2			
3			

ACADEMIND

	1	2	3
1	0	1	1
2	0	0	0
3	0	1	

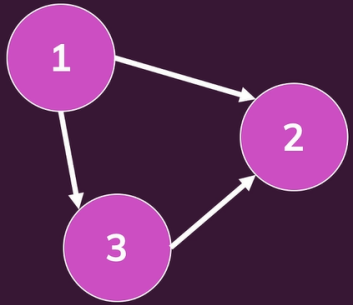
ACADEMIND

Adjacency Matrix

	1	2	3
1	0	1	1
2	0	0	0
3	0	1	0

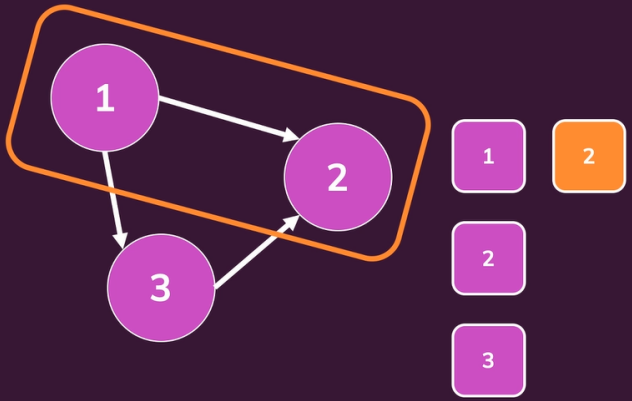
ACADEMIND

Adjacency List



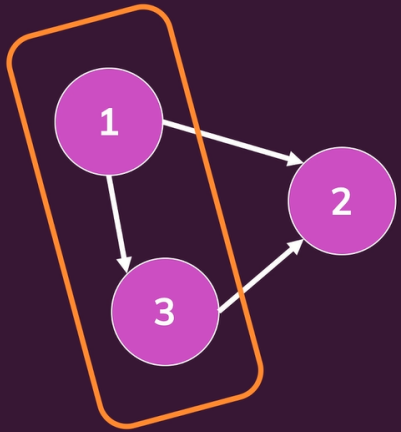
ACADEMIND

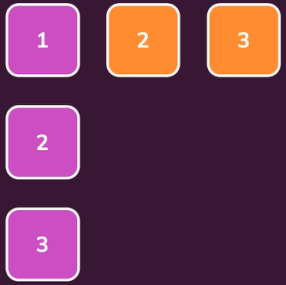
Adjacency List



ACADEMIND

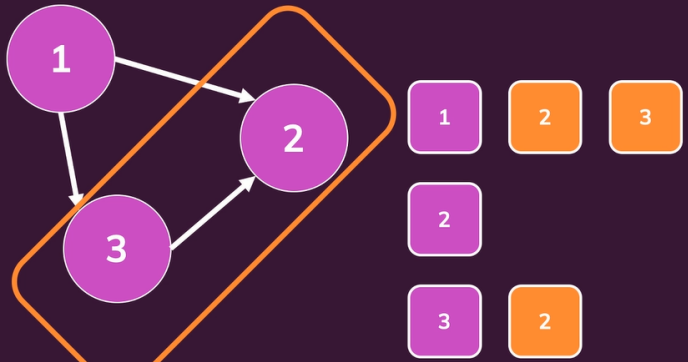
Adjacency List





ACADEMIND

Adjacency List



ACADEMIND

Adjacency Matrix

	1	2	3	4
1	0	1	1	1
2	0	0	0	0
3	0	1	0	0
4	0	1	0	0

ACADEMIND

Adjacency Matrix vs List

We'll use this!

	Adjacency Matrix	Adjacency List
Time Complexity		
Insert	**O(n)**	**O(1)**
Find Edge between Nodes	**O(1)**	**O(n)** or **O(1)** (depends on implementation)
Find all adjacent Nodes	**O(n)**	**O(1)**
Space Complexity	**O(n^2)**	**O(n+e)**
